INTRODUCTION

- The database named 'tp' (at the backend) is all about a travelling site named 'Travel Pool'.

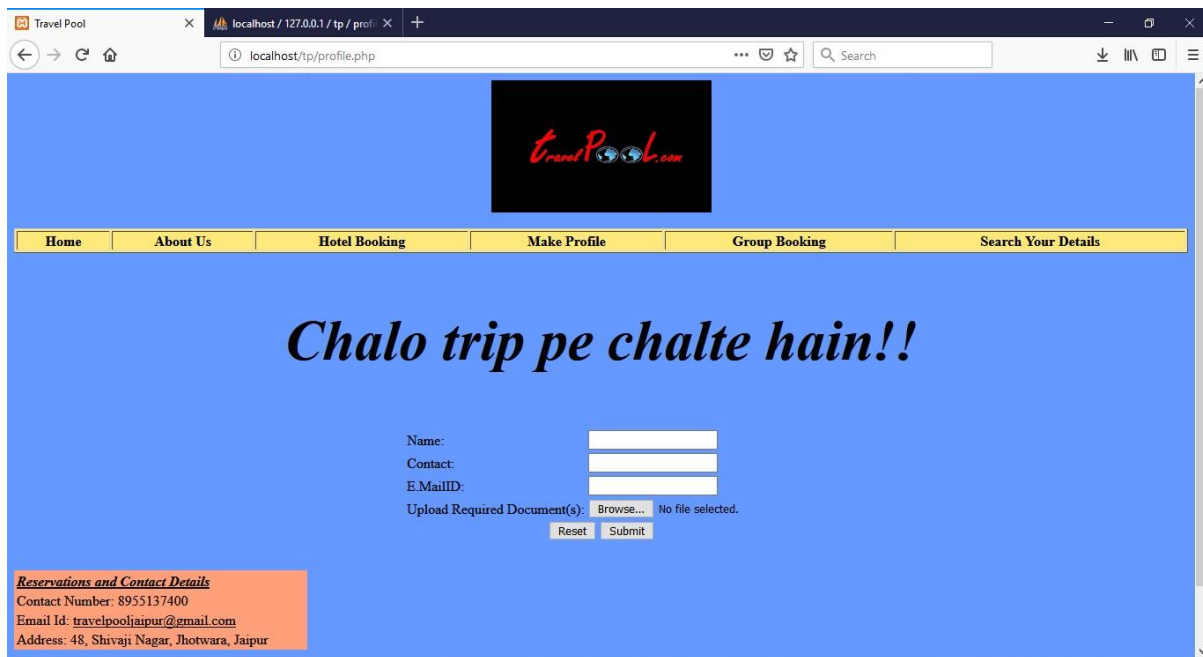

- It is comprised of 6 tabs (all are made as links) to redirect to the desired page.

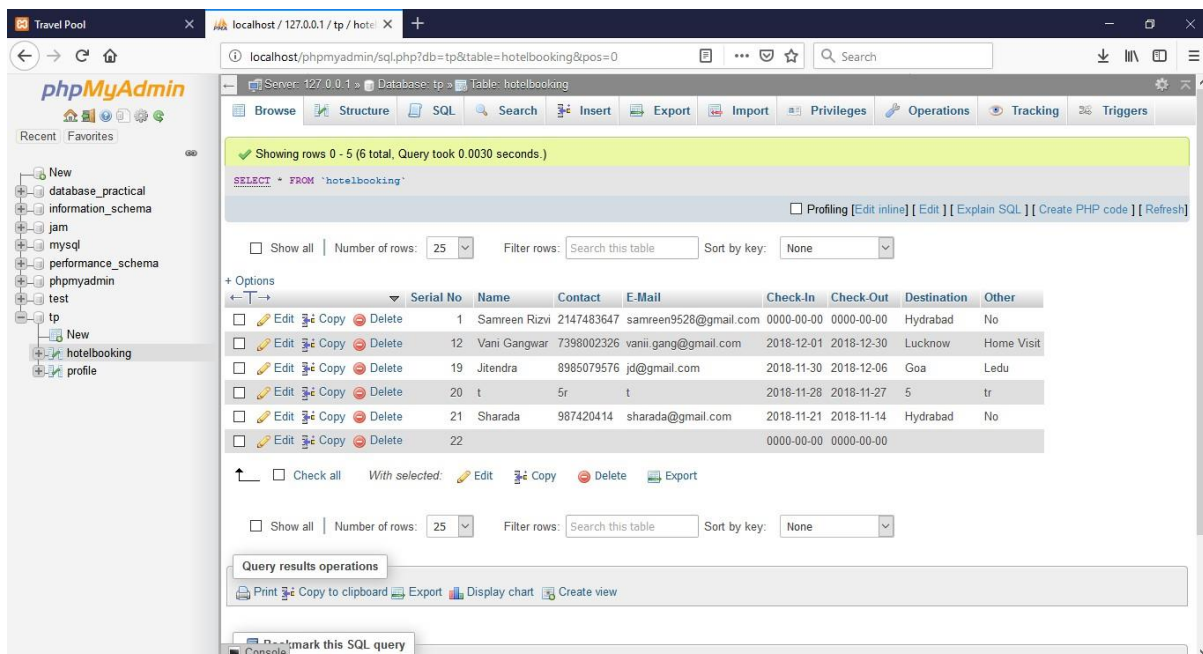

- The **submission** of the details can be done through **Hotel Booking** and **Make Profile** tab i.e., after entering the details in the respective fields, the values will be submitted to backend in the tables named as **hotelbooking** and **profile** respectively.

Hotel booking

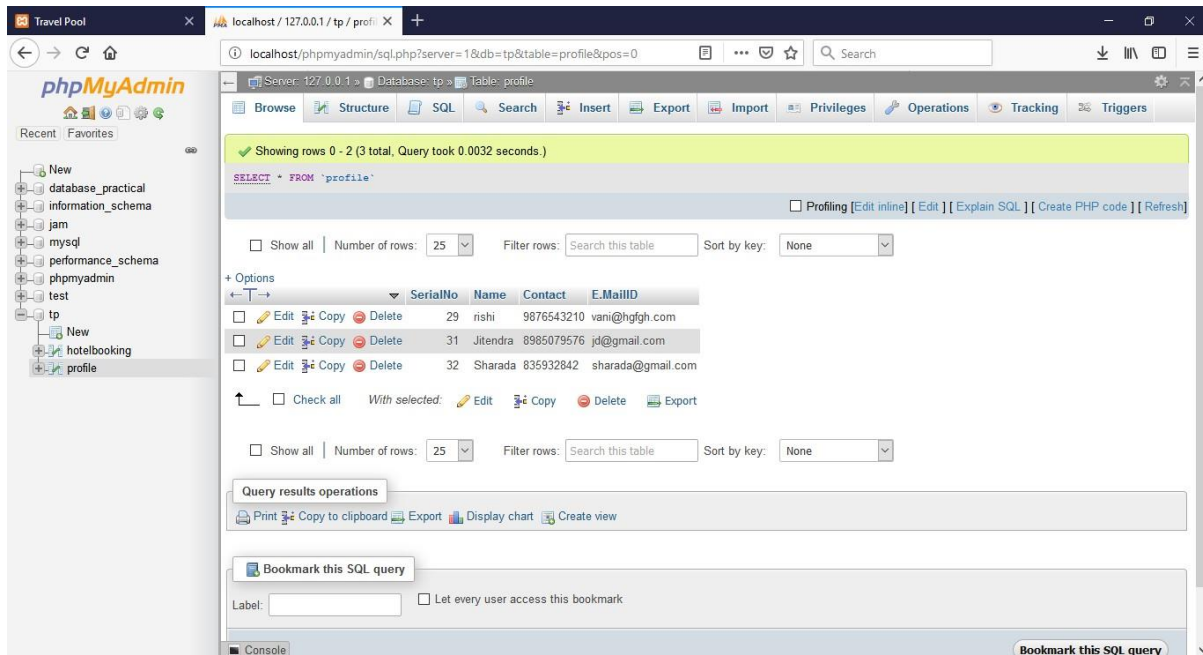

Make profile

- Once the values are given and submitted by the user, at the frontend, it redirects to a page showing thankyou for the details after being redirected to the respectively php files which makes the connection between frontend and backend.

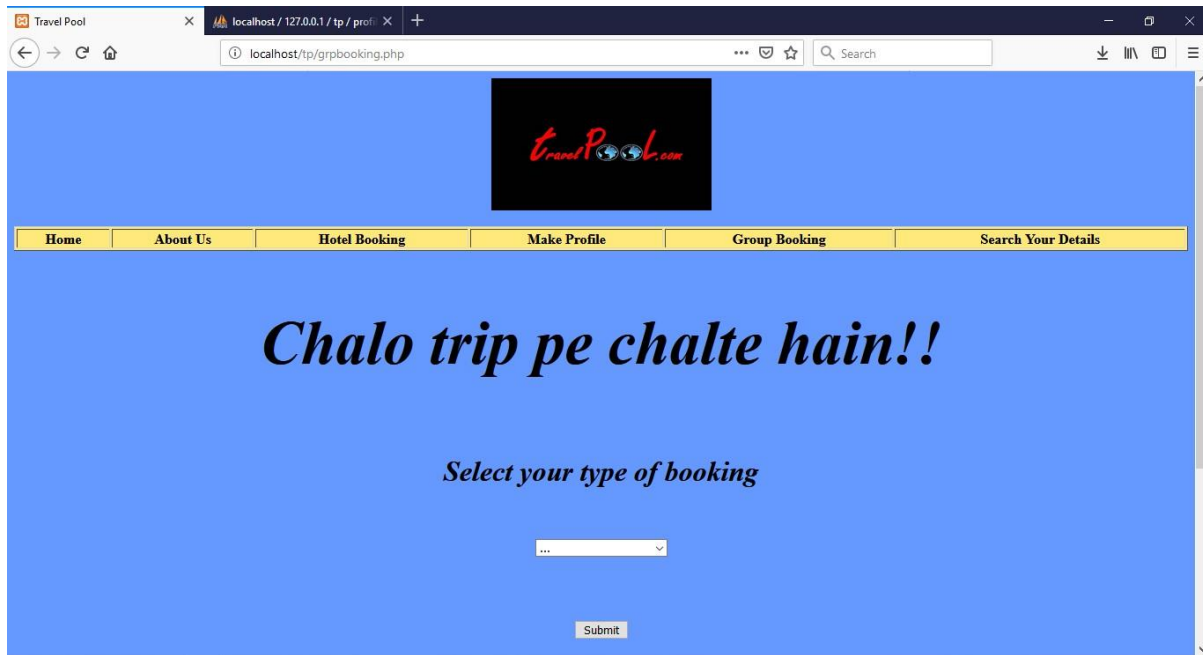

Hotel booking table

Profile table

- At the backend, the first column is Serial Number (made as primary key) which serializes the values entered by the user so if any details are deleted in between it doesn't gets updated rather gives the next number as serial number. (Since many datas are being deleted from the backend, that is why some numbers are missing but they are ordered).
- The profile page has **upload** option as well which supports all the formats and saves in the folder named upload.
- There is a tab named **Group Booking** which has a dropdown menu to choose either of the two option which redirects to same page as that of hotelbooking and will save the values at backend in hotelbooking table only.

- The last tab in **Search Your Details** which searches the details by name (given by the user) from the profile table present at the backend.
